1.0 GENERAL DESCRIPTION

1.1 Introduction

The 3.5inch TFT-LCD Module is a Color Active Matrix TFT LCD panel using LTPS (Low Temperature Poly-silicon) TFT's (Thin Film Transistors) as an active switching devices. This module has a 3.5 inch diagonally measured active area with 1440*1600 resolutions (1440 horizontal by 1600 vertical pixel array). Each pixel is divided into RED, GREEN, BLUE dots which are arranged in vertical stripe and this module can display 16.7M colors. The TFT-LCD panel used for this module is adapted for a low reflection and higher color type.

Note 1: If the module exceeds the absolute maximum ratings, it may be damaged permanently. Also, if the module operated with the absolute maximum ratings for a long time, its reliability may drop. It is not allowed for any of these ratings to be exceeded. Make sure all the design characte ristics are adequate before the panel is initialed.

Note 2: Temperature and relative humidity range are shown in the figure below. Wet bulb temperature should be 39 $^{\circ}$ C max. and no condensation of water.

4.0 OPTICAL SPECIFICATION

4.1 Overview

The optical characteristics should be measured in a dark room (ambient luminance≤ 1 lux and temperature = $25\pm2^{\circ}$ C) with the equipment of Konica Minolta CA-310 and CS-2000 and test unit shall be located at an approximate distance 50cm from the LCD surface at a viewing angle of θ and Φ equal to 0° . The center of the measuring spot on the display su rface should stay fixed.

The operation should be under the recommended operating conditions.

<Table 6. Pin Assignments for the Interface Connector>

Remark:

Port A&B are determined by the value of BA register : When BA Register is assigned to 07 ,only port A is valid When BA Register is assigned to 03, port A and B are valid.

VDDI is defined as "H" level and GND is defined as "L" level.

us

B2006-5006-O (3/3)

Signal	Symbol	Parameter	MIN	TYP	MAX	Unit
	t _{RW}	Reset pulse duration (Note 1)	10	-	-	ms
		Depart correct (Nate 2)	-	-	10	ms
REGA	^L RT	Reset cancel (Note 2)	-	-	120	ms
	t _{DSTB}	Reset pulse duration	10	-	-	ms

Note :

- The reset cancel also includes required time for loading ID bytes, VCOM setting and other settings from EEPROM (or similar device) to registers.

This loading is done every time when there is HW reset cancel time (tRT) within 10 ms after a rising edge of RESX.

- Spike due to an electrostatic discharge on RESX line does not cause irregular system reset according to the table below:

RESX Pulse	Action
Shorter than 5µs	Reset Rejected

- During the Resetting period, the display will be blanked(The display is entering blanking sequence, which maximum time is 120 ms, when Reset

Starts at Sleep-Out status. The display remains the blank state in Sleep-In mode). Then return to Default condition for Hardware Reset.

- Spike Rejection also applies during a valid reset pulse as shown below:
- When Reset applied during Sleep-In Mode.
- When Reset applied during Sleep-Out Mode.
- It is necessary to wait 10ms after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120 ms.
